

Keystone Citizen Advisory Group

Option #7: Existing Slip with Jetty East

Key Features

After looking at the results of the physical and computer harbor modeling, WSF has developed a new harbor option. Key features of this option include:

- Relocate existing rock jetty approximately 300 feet to the east
- Widen navigation channel from 200 feet to 400 feet as measured at the bottom
- Align terminal slip with the new channel center line
- Add holding area capacity adjacent to the existing holding area
- Relocate terminal building east of existing location
- Relocate recreational boat launch to new, dredged edge of harbor
- Relocate Keystone Conservation Area east of existing location
